

Quick Start

Disc Library for Windows

0. Make sure you have the Java Runtime Environment (JRE) installed on your computer. Disc Library requires the JRE at the 1.4.0 (or later) level. The Disc Library setup program will search for the location of the **javaw.exe** file, and if it is not found, Disc Library will not be installed. If you do not already have the JRE installed, it is a free download from <http://www.java.com>. You will also need the Adobe Acrobat Reader to view the Disc Library manual.
1. Save the **SETUP.EXE** file for Disc Library in a folder and double-click on this file (or enter **\my-folder\SETUP.EXE** in the Run pop-up window from the Start Menu). If you have a Disc Library CD-ROM, just insert the disc in your CD-ROM drive, and the **SETUP.EXE** file should start automatically (if not, you can double-click the **SETUP.EXE** file in the CD-ROM's root folder).
2. Follow the instructions on your screen. When the setup has finished, you will have Start Menu entries for three versions of Disc Library (and also icons on your desktop, unless you unselected them during the setup).
3. The three versions of Disc Library are: Master, Remote, and Demo. The Master version is the one you will use to control your CD changer(s). The Remote version is used on other computers in your house, after you have the Master version working. The Demo version can be run at any time, if you just want to familiarize yourself with the product (it does not actually connect to CD changers).
4. Select the Disc Library Master program from the Start Menu (or double-click the icon on the desktop). The Master program will tell you that it has not yet been configured, and present you with a Configuration Panel. Click on the buttons to indicate which COM ports on your computer are connected to CD changers, and how they are connected (using a SAVR or a Slink-e adapter, as appropriate). Leave the "Support for Remote Panels" disabled, for now.
5. Save the configuration, exit from the Disc Library Master program, and then re-start it. This time, the Master program will check each of your configured COM ports for CD changers. If you have configured the program correctly, the changers will all be found, but the Master program will tell you that it could not find their "slot files".
6. Now go to the Setup panel in the Disc Library program. For each CD changer in turn, select the CD changer from the list, click the **Database Operations** button, and then click **Perform Operation** in the "pop-up" dialog. This will take awhile, as Disc Library has to read the Table of Contents from each CD in each changer, and then look them up in the Internet database. Depending on the number of CDs and the speed of your Internet connection, it can take anywhere from a few minutes to over two hours per changer.
7. When you have finished the **Database Operations** activities, you are ready to Play!
